

XSB provides software and services for component product search, selection, management and design. Our patented parts data management and semantic web-based solutions address the standardization problems and data inconsistencies commonly associated with integrating and managing large engineering product databases.

Parts Management Solutions

Large enterprises rely on our MDF (Master Data File) technology to help them reduce the costs associated with product selection, fair market pricing, inventory reduction, item obsolescence and regulatory compliance.

- Accurate, integrated information on 65 million products from thousands of suppliers
- Collect, organize and maintain a single version of component parts data accessible to the enterprise, its customers and suppliers

In a recent study XSB identified \$5.5B in savings from the elimination of duplicate parts across three Fortune 100 companies.

Product Life Cycle Management Solutions

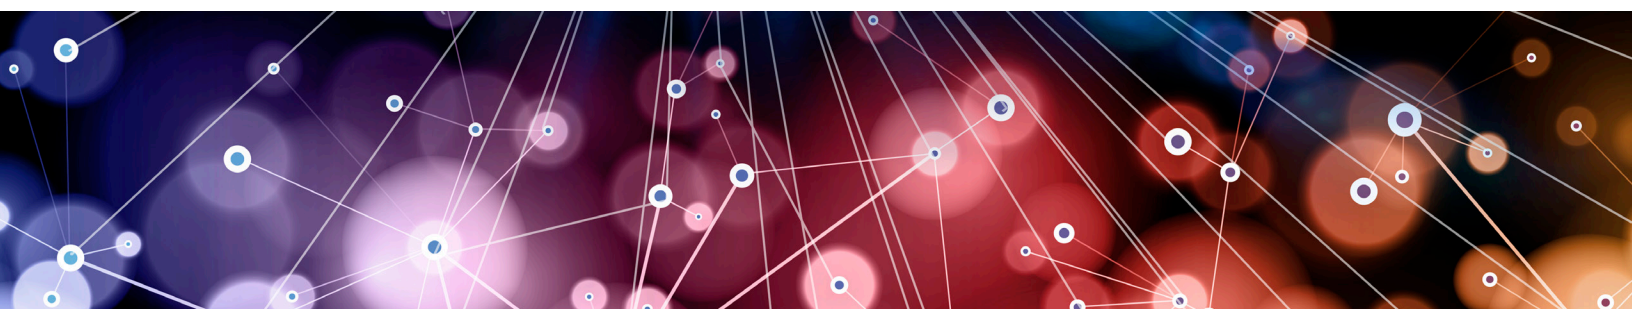

SWISS (Semantic Web for Interoperable Specs and Standards) extends our parts management technology to include the knowledge about parts and related processes governed by specifications and standards. This emerging technology is designed to support engineers who manage the entire product life cycle.

- Access information on parts, their manufacturers and suppliers, materials, technical characteristics, and other requirements through PartLink*
- Create special-purpose documents - testing, manufacturing, maintenance - by creating links to the concepts in the relevant specs and standards
- Become aware of the impact of changes from within and outside the enterprise
- Prevent costly quality and compliance problems that result from using obsolete information

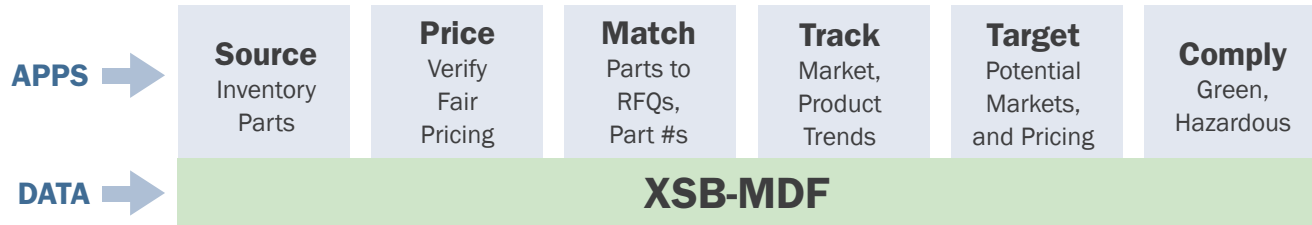

* PartLink is a linked data platform being developed by XSB under contract with the Defense Logistics Agency (DLA).

ACTIONABLE DATA THAT DRIVES BUSINESS DECISIONS

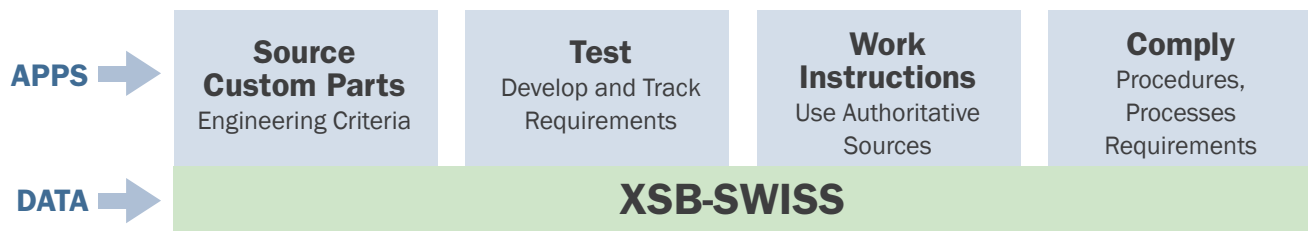

www.xsb.com

Parts Management - MDF

Product Life Cycle - SWISS

Web Service - API

Our solutions are available as a Web Service, this allows machine-to-machine integration into enterprise systems.

Web Crawlers

Our Focused Crawler technology enables the automated collection of product specific data from web based catalogs which is used to enrich part characteristics.

Select Customers
